branch: Firefox OS 1.4 (gecko30)

CompositingRenderTargetOGL is used for intermediate layer drawing.
In this case, all child layers are drawn to FBO and the FBO is used for OpenGL composition.
Intermediate layer is used in the following situations.
- MaskLayer is present
- opacity is not 1.0f && Has Multiple Children
- (Transform is not 2D transform || Has Non Integer Translation) &&
(child's clipRect is not empty || child has mask layer)
See ContainerLayer::DefaultComputeEffectiveTransforms()

Effects and effect chains are used by the compositor API. An effect chain represents a rendering method, for example some shader and the data required for that shader to run.

Render from a texture

Render to a render target rather than the screen.

Interface for texture objects that can be composited by a given compositor backend.

Used as an offscreen rendering target by the compositor, and subsequently can be used as a source by the compositor.

OpenGL backend offscreen rendering target by used the compositor
